

OLOS

The Open Network for Customer Loyalty

A new infrastructure layer for loyalty value

EXECUTIVE INTRODUCTION — FOR CEOS, MERCHANTS, BANKS & INVESTORS

Every program keeps its own books.

No one consolidates the balance.

A trial balance for the loyalty industry, and why it never closes.

LIABILITIES

Merchants collectively carry **hundreds of billions** in unredeemed point and mile liabilities — value promised to customers and sitting, unspent, on the balance sheet.

HOLDINGS

The average loyal customer holds **dozens of separate balances** across programs — most too small, too narrow, or too far from home to ever be worth redeeming.

REDEMPTION

Redemption rates stay **structurally low** — not because the rewards aren't wanted, but because there is no rail connecting one program's value to another's.

This is not a marketing problem. It is a missing settlement layer.

Every other value system that scaled past its first few players eventually admitted this and built shared infrastructure. Payments got a network. Banking got standards. Customer loyalty has never had its equivalent — each program remains a sovereign, disconnected ledger, and the industry has simply learned to live with a balance that never closes.

OLOS is the layer that lets those ledgers finally talk to each other — without any merchant surrendering control of their customers or their economics. The pages that follow show how.

One connection compounds into every direction at once.

The signature mechanic of an open loyalty network.

Interoperability sits at the center — each gain feeds the next, in either direction, indefinitely.

Unlike a coalition, OLOS does not ask merchants to pool their programs into one shared currency. It gives sovereign programs a common rail. That single design choice is what turns a network into a flywheel: more merchants attract more consumers, more consumers justify more transactions, and more transactions fund more merchant value — with interoperability, not control, as the shared center.

Four ledgers, four different gains — no single winner required.

Clear, distinct value for every stakeholder in the network.

CONSUMERS	MERCHANTS	BANKS	LOYALTY PLATFORMS
— More places to redeem value — A simpler, unified experience — Better, more relevant rewards	— Higher engagement & retention — Lower integration & partnership costs — Instant new partnerships	— Increased card usage & loyalty — New value-added services — Stronger merchant relationships	— Larger addressable market — Easier, standards-based integrations — An open, neutral ecosystem

There is no single winner. OLOS creates mutual, sustainable value across the entire ecosystem.

Simple integration for merchants. Powerful effects for everyone.

A simple view of the network, for decision makers.

fig. 4.1 - network architecture

Two neutral layers — Gateway and Settlement & Netting — sit between participants and let value move without merging their systems.

Merchants integrate once, at their existing point of sale, and reach every connected bank, platform, and merchant on the network. The Gateway Layer routes and validates value in flight; the Settlement & Netting Layer reconciles what each party owes the other — the ledger, finally, that closes.

Ready for the full picture.

You now understand the core idea.

§ Loyalty is broken because it lacks shared infrastructure.

§ OLOS provides that infrastructure as a neutral, open protocol.

§ Value flows through interoperability, not through control.

§ Everyone wins when the network grows.

THE FOLLOWING PAGES CONTAIN THE FULL DETAIL

- The structural problems in today's loyalty landscape
- Why existing solutions — coalitions, exchanges, crypto — fall short
- The complete architecture and protocol design
- Governance, commercial model, and adoption roadmap

This is not a product pitch. It is a blueprint for the next era of customer loyalty infrastructure. We invite merchants, banks, technologists, and policymakers to join us in building the settlement layer that loyalty has always needed.

The future of loyalty is open, sovereign, and liquid.

OLOS is the protocol layer that makes it possible.
